## 1. Summary

On behalf of University **of Southampton** as represented by the **SOUTHAMPTON OCEANOGRAPHY CENTRE (SOC), GeoPro GmbH- Hamburg** performed from 17<sup>th</sup> of February till the 11th of March 2005 a WARRP (Wide Aperture Seismic Profiling) seismic survey in Black Sea, within Turkish economic zone

Thirty four (34) Ocean Bottom Stations (OBS) recording 3 geophone and one hydrophone each (4C-survey) were deployed in water depth ranging from 400 to 2200 meters along 4 seismic lines. Length of each line varied between 500 and 200 km and the spacing of the OBS positions had to be adjusted accordingly. The seismic signals were generated by airgun array of 3340 cubic inch or 54.6 litres volume firing at 60 to 90 seconds. The 90 seconds shots interval was necessary in order to avoid interaction between acoustic energy travelling through the water with seismic signals having propagated through the thick sediments in crust of this area. Energy obtained by these shots exceeded 200 km.

In total 7046 shots fired at 115 to 170 km spacing, producing 80 common station 4C-gathers (CStG). Two OBS positions were lost, one on profile 1 and one on profile 4. Bad weather conditions caused delay and strained the crew – scientific and marine – extending the survey by a period of 4 days.

Data processing is now completed and CStG prepared in SEGY format were delivered. Stations have been treated for timing effect due to clock drift

## 2. Acquisition

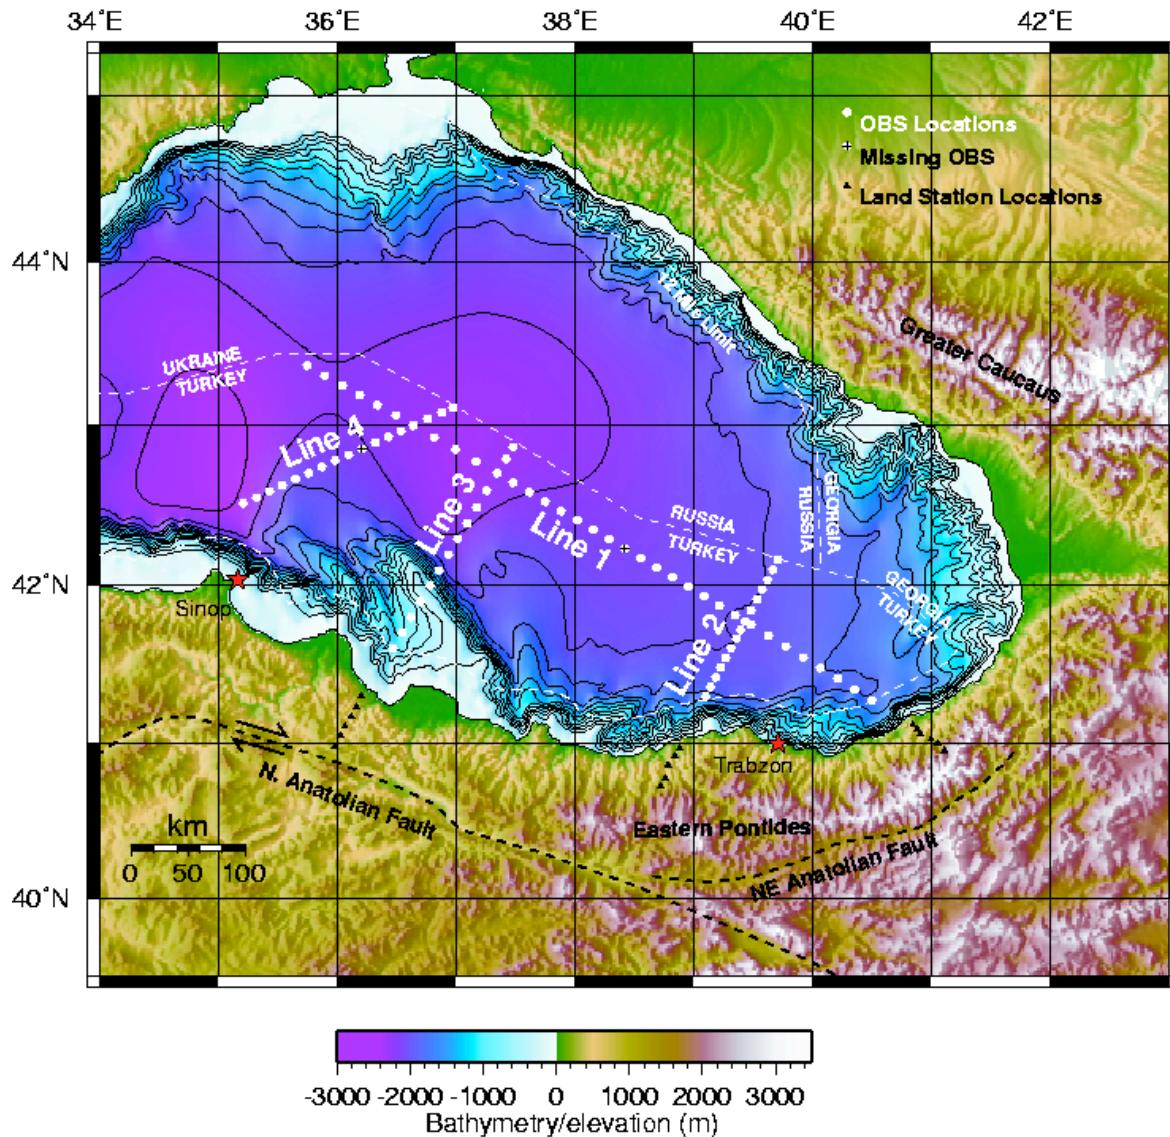

Fig.1 Location of Profiles

### 2.1 Timing and details

The survey commenced on 17th February 2005 and seismic acquisition was completed on 11th March 2005. The R/V ISKATEL, a 54.8 m long vessel was used to perform the marine operations. The OBS were deployed in a first pass along each line at an average spacing between 8.3 km and 13.6 km. Then shooting was performed along each line at an average speed of 4 knots and 60 to 90 seconds firing frequency. At a third pass along the line OBSs were acoustically released and collected upon surface.

A total of 80 OBSs were deployed and all of them except of 2 were recovered. On profile 1 - 34 the OBS were spaced at a distance of 13.6 km. On profile 4 - 17 the OBS were spaced at a distance of 8.3 km. On profile 3 - 14 the OBS were spaced at an interval of 12.6 km and on profile 2 15 OBSs were spaced 8 km apart. A 55 litres airgun array was employed as the energy source. The shot spacing varied from 115 m on profile 1 and 2 (1 minutes shooting interval) to 170 m on profiles 3 and 4 ( 90 seconds shooting interval).

Appendix 4.1 to 4.3 provides detailed information on the deployment and recovery of the OBS, their coordinates and water depths. Shooting tables with coordinates and water depth under each 10<sup>th</sup> of airgun shot on profile 1, 2, 3 and 4 are placed in Appendix 4.4, 4.5, 4.6 and 4.7

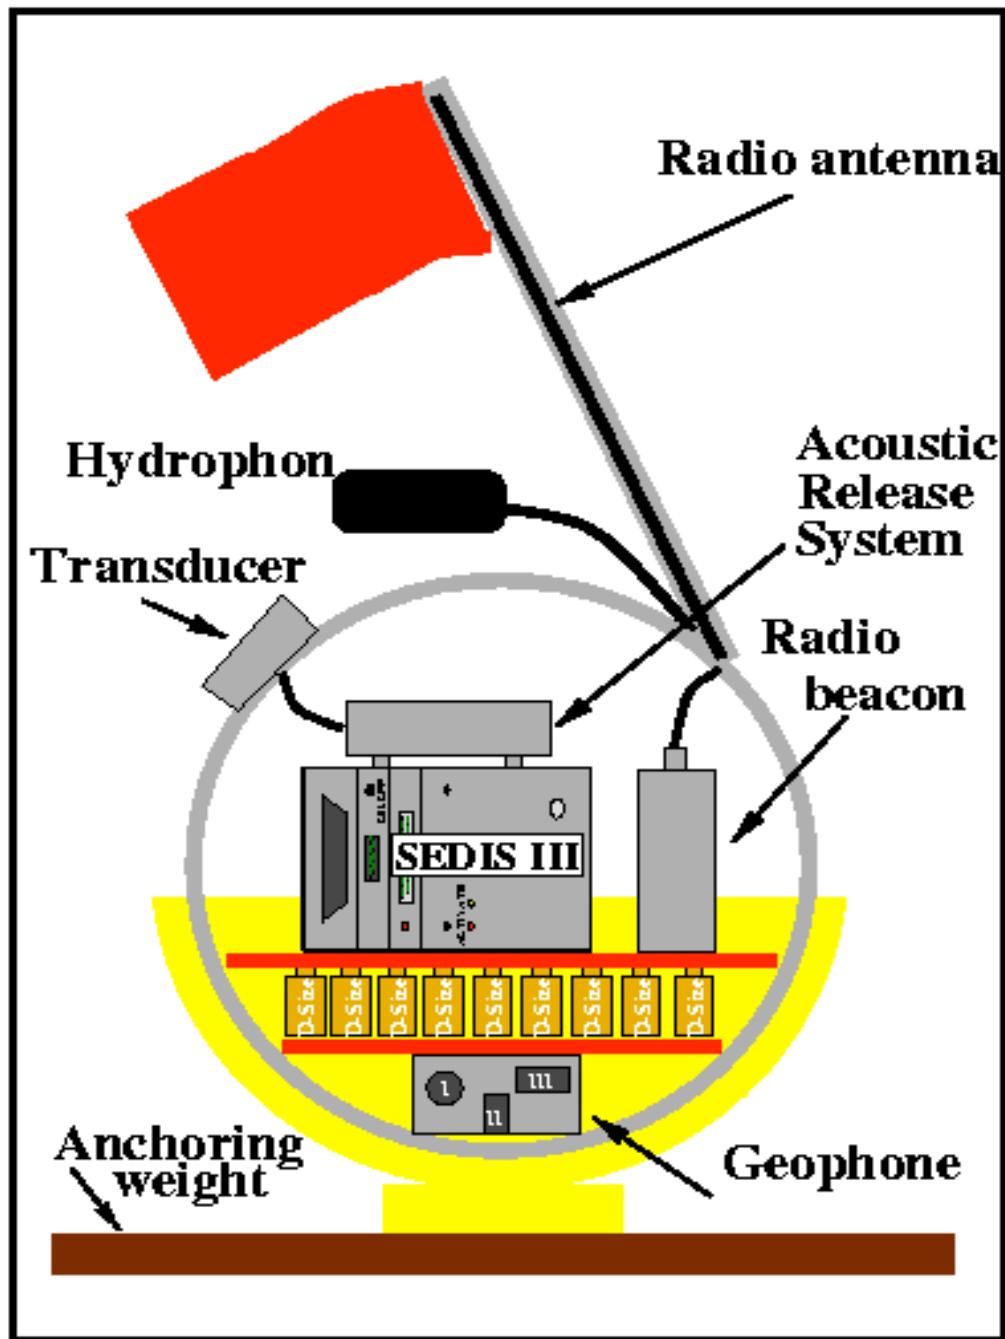

Fig. 2. Sketch of OBS GeoPro GmbH

## 2.2 Ocean bottom station

The OBS, designed by *GeoPro GmbH*, is a seismic stand-alone station, which can be deployed up to a water depth of 6700 m. A sketch of an OBS is shown in Fig.2. The seismic recording unit SEDIS III or SEDIS IV, constructed by *GeoPro GmbH* is housed in a 17inch (430 mm) diameter glass sphere, which also contains the power pack and electronic release. External components are a transducer connected to the acoustic release, a hydrophone, the mechanical release unit; hand a flags and antenna for the radiolocation. A rigid protection covers the glass sphere. During deployment and recording, the instrument is attached to a 17 kg iron anchor, which keeps the OBS attached to the seabed. The total weight of the instrument including the anchor at deployment is 42 kg in air.

To locate the instrument after it has released from the anchor and risen to the surface, three items are integrated and attached to the unit, these being a reflective flag for daylight observation, a halogen light for recovery at night and a radio beacon transmitting on a frequency received by a direction finder onboard the vessel.

Power is supplied by a battery-pack consisting of 49 alkaline 1.5 V D-size batteries, two 9V block batteries and 25V power supply consisting of rechargeable batteries.

By using the acoustic release, the instrument can be ranged from the ship in order to obtain its location on the seabed and during ascending to the surface. Depending on the weather conditions one or several instruments may be released. The timer and the acoustic release systems are connected to an electronic unit, which activates the burn wire of the release system, 2 minutes later the flashlight and 10 minutes later the radio transmitter. The burn wire that locks the anchor to the instrument corrodes rapidly releasing the OBS which rises to the sea surface with a speed of about 0.6 m/sec.

Three seismic recording channels - one vertical and two horizontal - 4.5 Hz geophones are housed in the bottom of the sphere. They are gimbal mounted and suspended in a viscous silicone fluid. A fourth channel is records the hydrophone.

The current OBS version also uses an electronic compass which is connected to serial port of the SEDIS unit and shows the orientation of horizontal components of geophone. One compass reading is taken when the instrument starts recording. Recording always starts after instrument is landed on the seafloor, in order to protect the hard disk.

The seismic recording unit SEDIS III has a size of 205x105x200 mm, (Fig. 3) is based on a low power consumption Motorola 360 power down microprocessor and has a 16 bits analogue-digital converter (ADC) for 6 channels, a precise quartz clock and a hard disk for storing of recorded information. The internal clock is synchronized by the second's pulse of an external GPS receiver. For on-shore operations the GPS receiver is also recorded at given time intervals.

The communication with Sedis III is achieved through a serial port (9 pins female plug on front panel of Sedis, see Fig. 4).

Fig 3. 6 channels portable seismic recording unit – Seids –III is ideal for offshore and on-shore applications

The instrument has variable recording capacity from 5 to 40 Gigabyte depending on the type of hard disk installed.

## 2.4 Airgun array

The Airgun array consisted of 2 independent airgun lines deployed from port and starboard sides of the vessel. We used 9 Bolt guns with total volume of 3340 cubic inches (54.7 litres) and air pressure of 145 bars. Depth of shooting was 9 to 10 meters depending on the ship speed, which varied between 3.6 to 4.1 knots. The configuration of the airgun array is outlined on Figure 4.

To determine and adjust the individual firing times of each source element (single airgun) and to detect and monitor misfires and auto fires we used the Long Shot airgun controller. During the operation, firing accuracy of each gun was within two milliseconds with respect to aimed firing time. Gun mask data and actual gun timing accuracy were logged in real time and printed by a matrix printer attached to the Long Shot airgun controller.

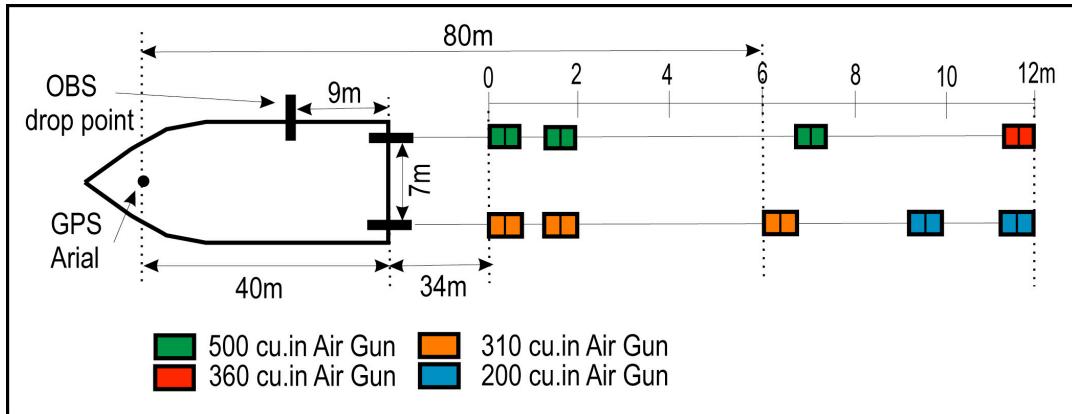

Fig. 4 Airgun array configuration

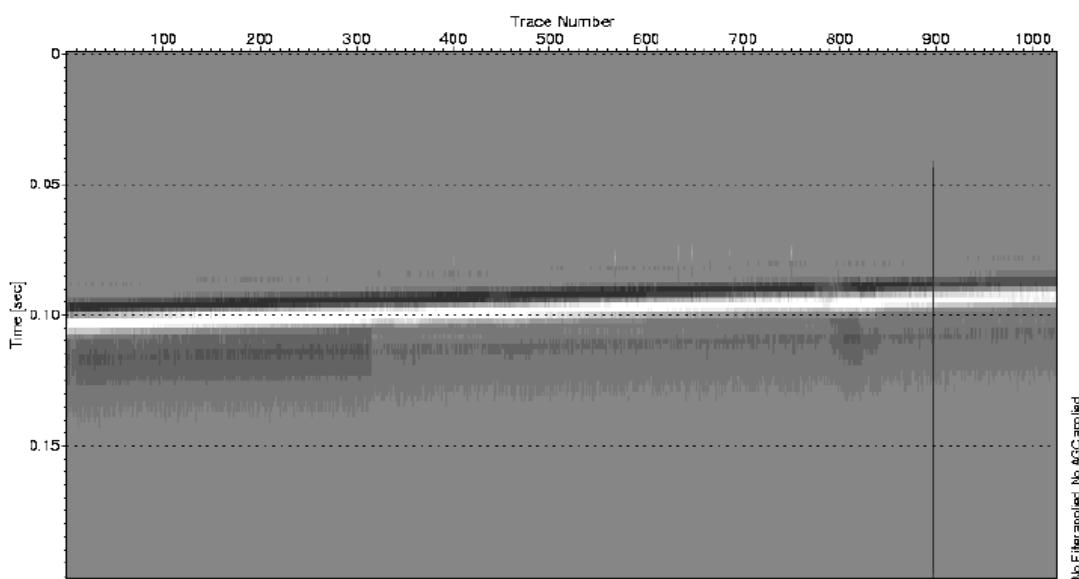

A highly stabilized external master clock triggered each actual shot produced by the airgun controller. Master clock was synchronized to UTC time with the help of a GPS receiver.

We performed 7046 shots along the four profiles with:

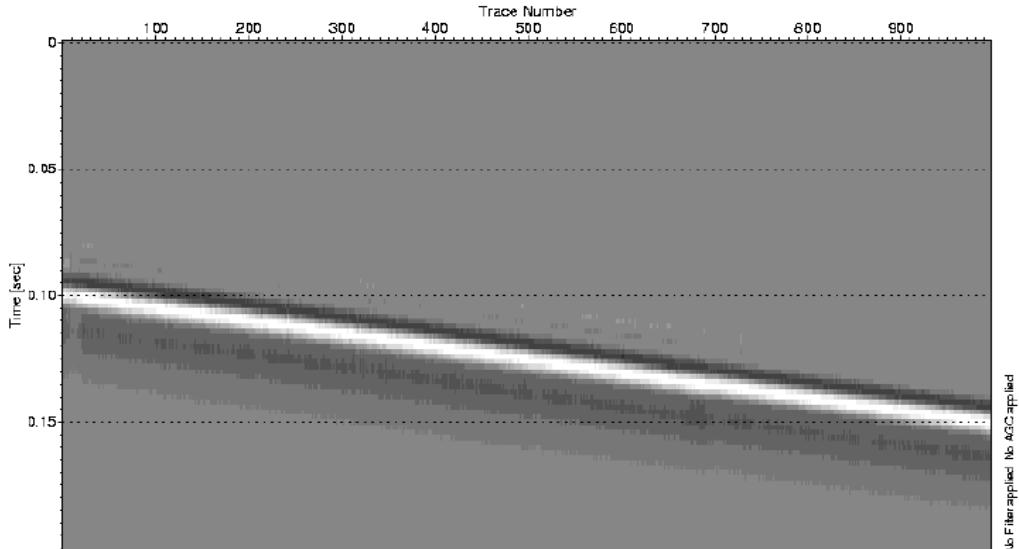

- 3959 shots (every 60 seconds) on profile 1
- 1065 shots (every 60 seconds) on profile 2
- 1025 shots (every 90 seconds) on profile 3
- 997 shots (every 90 seconds) on profile 4

We used Sedis III recorder to obtain each individual airgun shot in exact UTC time. In figure 5 and 6 we show examples of actual filed time break recorded for Profile 3 and 4. The linear Sedis III clock drift in reference to GPS time is obvious. Taking into consideration the Seidis III constant delay of 38 milliseconds for 512 Hz sample rate we can see a constant delay of 50 milliseconds for all shots.

Fig.6 Field Time Break recorded by SedisIII on Profile 3

### 3. DATA PROCESSING

#### 3.1 Data Processing Flow

The data acquired on the profiles were subjected to the standard processing graphically shown below. Data processing consists of the following steps:

- 1 - Data extraction from hard disk (raw data) and control files (shooting time)
- 2 - Demultiplexing (incl. correction of time drift as defined from log file)
- 3 - Resampling
- 4 - Determination of OBS positions (from water wave arrivals)
- 5 - Reformatting to SEG-Y data files (incl. filtering and normalization)

#### 3.2 Data Extraction and Demultiplexing

2.5" Notebook hard disk devices are used by the GeoPro SEDIS-III system to store seismic data. These are processed on a Linux based PC and Sun local area network (LAN) environment. In addition to the seismic data, the following information is also stored:

Acquisition parameters:

Sampling rate

Number of recording channels

Date and time of:

Initial clock synchronization with an external GPS clock

Start of recording

End of recording

Final time comparison between the SEDIS internal clock and the external GPS clock

The instrument internal temperature

Processing of the field data consists of the following steps:

Extraction of the seismic information from all recorded data.

The shooting times are extracted from the navigation data and reformatted to fit the input format for the data reading routine. The desired data windows of arbitrary length are read from the field records and stored in a disk file. This step results in one disk file ('Mpsegy data file') per OBS unit.

Demultiplexing.

Each raw data file is demultiplexed resulting in a data file containing all seismic traces for one channel of one OBS sorted by shot times.

The data are then resampled in CWP/SU format and written to SEG-Y tapes to satisfy the requirements for further data processing and modelling.

As the internal clock of each recorder is subject to a temperature dependent drift, the extracted data windows are time shifted in relation to UTC time according to the determined drift corrections. Correction procedures are as follows:

The recorder internal clock is synchronized with UTC time prior to deployment using the GPS system. The exact date and time of synchronization is recorded by the instrument and also logged manually in the OBS field protocols.

After recovery of an OBS, the recorder internal clock is compared with UTC time. The difference between both times, and the time of comparison are recorded by the instrument.

Finally, the time shift for each data window is calculated using linear interpolation. This approach is justified by the fact that the ambient temperature of the internal SEDIS clock is constant. A rapid temperature change can also be considered as the instrument continuously records it and a variable clock drift calculated.

### **3.3 Data Reformatting**

The final data set was reformatted and delivered in SEG-Y format on Client's hard disk via fast Ethernet link.

### **3.4 Geometry calculation for the SEGY trace headers**

The SEGY headers contain the following information:

Source Longitude in arc seconds  
Source Latitude in arc seconds  
Water depth at source position  
Receiver Longitude in arc seconds (OBS)  
Receiver Latitude in arc seconds (OBS)  
Water depth at receiver position (OBS)

## Offset (source -receiver distance)

The offset calculation is performed in a Gauss- Krueger projection of the geographical coordinates along the direction of each profile. The origin of the local coordinate system coincides with the first production shot on a profile. The direction of the inline local axis is determined by the last production shot on the profile.

### 3.5 Time corrections explanation

Time of each trace in *SEGY* file was corrected to airgun field time break delay ( 50 milliseconds) , constant Sedis III time delay of 76 miliseconds ( for 256 Hz sample rate of data collecting) and Sedis clock drift according to comparasion with the GPS clock. We used a linear clock dirft since the temperature on the seabed is constant. Resulting time corrections were placed in *delrt* *SEGY* trace header:

```
short delrt; /* delay recording time, time in ms between
               initiation time of energy source and time
               when recording of data samples begins
               (for deep water work if recording does not
               start at zero time) */
```

*delrt = -50 msec - 76 msec - sedisIII\_time\_corrections ( time dependent)*

Sedis III clock drift mesurements are outlined in appendix 3 for all recovered OBSs.

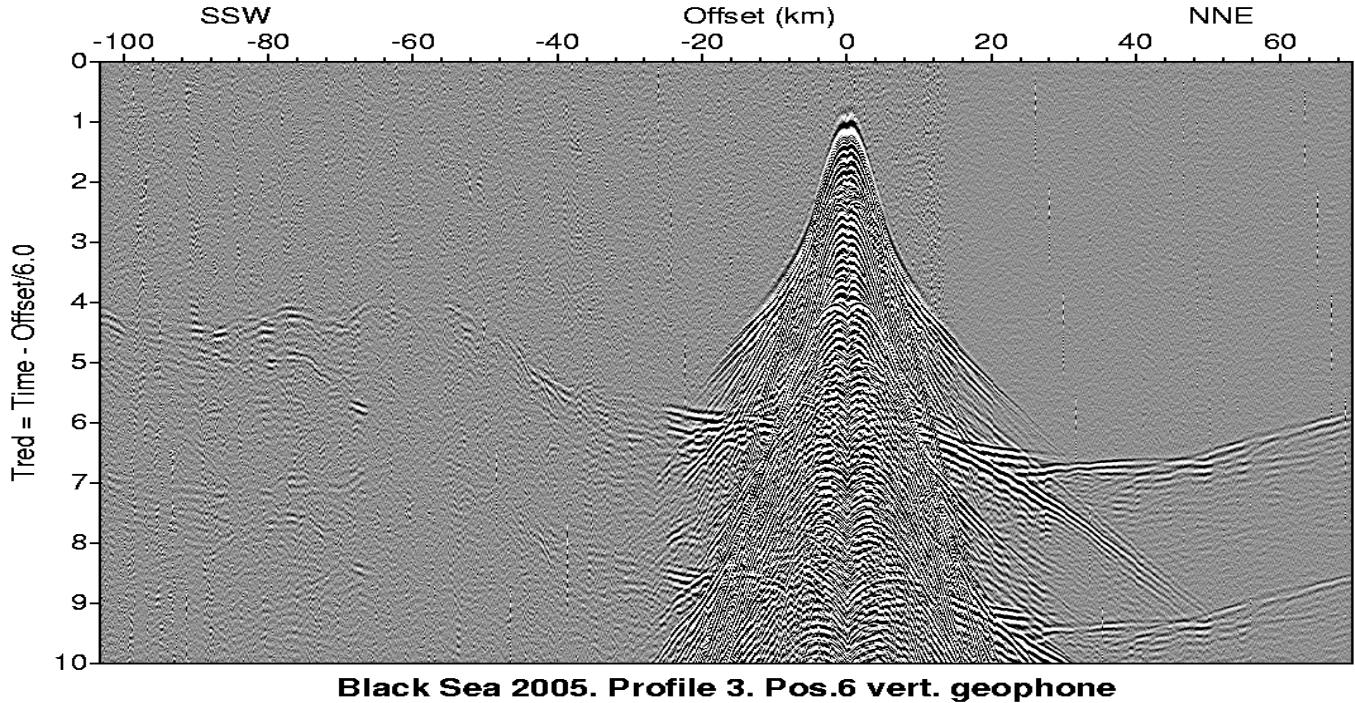

Fig. 7 Common receiver shot gather. OBS Pos. 6 Profile3. Vertical geophone. Linear moveout with velocity of 6 km/sec was applied to the data.

An example of common Receiver Station Gather with linear moveout of 6.0 km/s velocity is presented on figure 7. Energy as can be seen , propagated very efficiently.

### 3.6 Echo-sounder data processing

For sea bottom profiling the ATLAS DESO 30 dual frequency echo-sounder was used. The echo sounder tranducer was installed “over-the-side”. This installation mode does not permit to the vessel to exceed a traveling speed over 6 knots. For this reason the echosounder was used on a continuos mode only during shooting (speed 4.3 knots) and not during deploying and collecting OBS.

The echo-sounder reading were looged into the navigation computer together with GPS coordinates

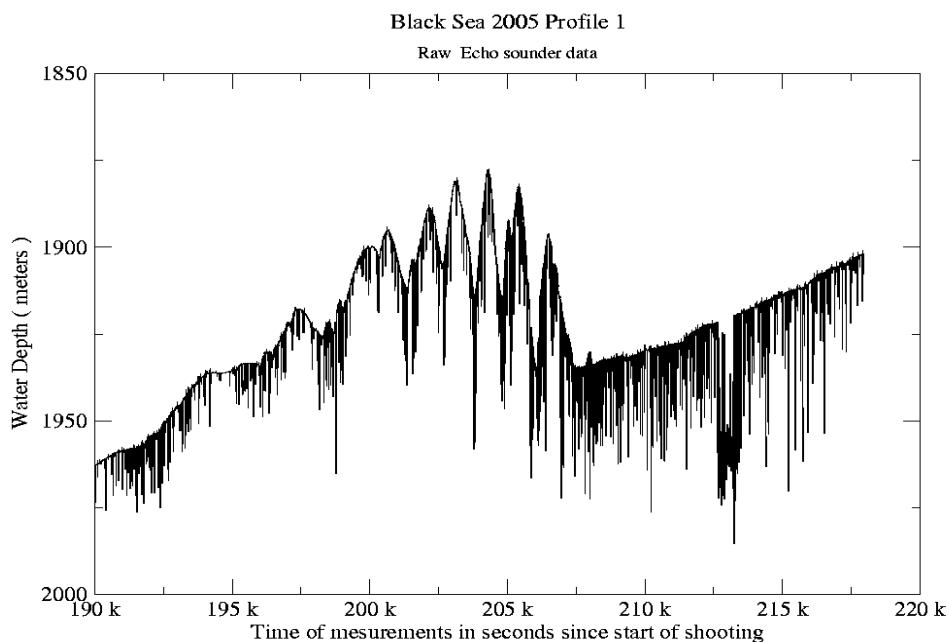

Fig. 8 . Raw Water Depth along the part of Profile 1

The over-the-side echo sounder installation is not a good solution for bad sea conditions since it produced noisy readings which had to be eliminated ny postprocessing. Figure 8 shows one example of unprocessed echo sounder data. We used several processing steps to clean up the depth records for each profile. The OBS depth was defined by projecting the OBS position into the shooting line. Examples of water depth profiles along the lines 1 and 3 are presented in Figures 9 and 10.

## **Appendix 4.8 DESCRIPTION AND SPECIFICATION OF VESSEL AND EQUIPMENT RV "ISKATEL"**

### **Type:**

Research, sea, steel, one-screw with the sunken tank, the lengthened average superstructure.  
Signal EOFV IMO 7646580.

**Purpose:** Vessel is intended for complex geology and geophysical surveys for study a geological structure and mineral resources.

### **Area of navigation:**

Unlimited, could come into broken ice areas during all year.

**Year and place of construction:** 1977, Khabarovsk.

**Port of registry and register #:** Port Ilyichevsk, 752374.

### **Rules of construction:**

Vessel is constructed on « Rules of classification and construction of sea vessels » the Register of the USSR of the edition of 1970. A class of the Register of the USSR is KM \_ 2 1 research vessel.

**Category of stability:** Unlimited area of navigation.

### **The main measurements:**

Length the greatest – 54.90 m.

Length on KVL – 50.88 m.

Length between perpendiculars – 48.00 m.

Breadth – 9.52 m.

Height of a board on a midel-frame – 5.167 m.

Height of a mast - 9,7 m.

Height of a superstructure – 2.40 m.

Draft maximal – 4.5 m.

Draft in empty - 3,8 m.

Displacement - 1140 t at average draft of 4,18 m.

Height of up-water board - 9,88 m.

Gross tonnage - 758 t

Net tonnage - 227 t

Carrying tonnage - 308 t.

### **Full stocks:**

Diesel fuel – 152.42 t.

Lubricant - 6.23 t.

Technical water – 50.65 t.

Drinking water - 36.12 t.

Non-mineral water - 21,02 t.

### **Autonomy:**

On the fuel and lubricant - 33 days

On potable water - 19 days, at use of 40 litres per day per person.

### **Water-proof sheets:**

On frames: 5, 12, 22, 37, 52, 68, 78.

### **The main engine:**

6 NVD - 48 A2V, capacity 1000 horse power, 736 kW.

### **Safety equipment:**

Life boats 2 for 25 persons

Safety rafts: PSN-10 - 5 pieces.

Safety rafts PSN-6 - 1 piece.

Lifebuoy rings - 8 pieces.

Life jackets - 45 pieces.

Diving suits - 20 pieces.

### **Alarm equipment:**

Lamp of the day time signal system - 1.

Ringing Bell - 1.

Whistle - 1.

Black rhombus - 1 piece.

Black spheres - 3 pieces.

Parachute alarm rockets - 12 pieces.

Line throwing device with 4 rockets.

### **The fire-prevention equipment:**

The fire pumps: 2 by 63 m<sup>3</sup>

The emergency fire pump: 1 with 25 m<sup>3</sup>

Fire hydrant - 6 pieces. Ø50 mm

Fire hoses - 6 pieces. Ø50 mm

The portable fire extinguisher - 9/8-7 pieces.

OPCH-10 - 7 pieces, 1 by 45 litres, 2 by 70 litres.

Fire Equipment - 3 complete sets.

**The anchor device:**

Anchor of the Hall - 2 pieces x 700 kg with anchor chain of Ø28 mm, L-362 m.

Anchor of the Hall spare – 1 piece x 700 kg.

**The cargo device:**

Crane HIBE-110 electro-hydraulic with the maximal carrying capacity of 6 tonnes

**The steering device:**

Type of the steering machine - RO-9; Power of 3.2 kW; a manual drive - emergency pump; type of a rudder - a rotary nozzle.

**The rowing screw:**

1 x 5800, number of blades - 3, screw - Ø 1,65m.

**Auxiliary engines (diesel generators):**

62N 18/22 - 3 pieces, 64 12/14 power of 80 horse power, 64N 18/22 - 225 horse power, the hour fuel consumption – 21.0 kg; lubricant - M10B2, lubricant consumption for 2 electric hours - 4.0 kg.

**Tanks:**

Soothing - 32,83 m<sup>3</sup>, gathering of wasted waters - 38,26 m<sup>3</sup>, waste - 4,50 m<sup>3</sup>, faecal - 3,29 m<sup>3</sup>, the wasted lubricant - 2,54 m<sup>3</sup>, a plum of a water-sediment - 1,7 m<sup>3</sup>, gathering of products of separation - 1,74 m<sup>3</sup>, diesel fuel # 1- 11.07 tonnes, # 4 - 17,68 tonnes, # 5 - 17,81 tonnes., # 6 - 43,68 tonnes, # 7 - 34,78 tonnes, # 8 - 7,94 tonnes, # 9 - 12,95 tonnes., a stock of lubricant oil - 4,96 tonnes, separated fuel - 1,66 tonnes, a sediment of fuel - 4,85 tonnes.

**Radio equipment:**

The basic systems - "REID-1"; RT-4822; "Brig"; INMARSAT –C; satellite safety radio buoys -

"KOSPAS -SARSAT" - 2 pieces; "MUSSON - 502", the equipment of 2 side communications IC-Gm15000, GLS, "PRIZIV"

**The special equipment:**

Air diesel compressors DK - 10 - 6 pieces. Digital streamer of 3 km active length

Navigating system " Navigator " with DGPS the receiver.

**The register of classification:** The classification certificate of the Register Valid till 14.12.2005.

Dock survey is valid till 14.12.2005.
